The Cycle of Cosmic Catastrophes: Flood, Fire, and Famine in the History of Civilization

By Richard Firestone, Allen West, and Simon Warwick-Smith

Publisher: Bear & Company (June 2006)

Pages: 392 - Price: \$20.00

Review by Lee Prosser - leep@ghostvillage.com

Ghostvillage.com review

This nonfiction book will have everybody talking about the cycle of cosmic catastrophes, and how it has affected myth and legend in cultures over a period of time. Every major culture has its own legends and myths of floods, fires, and weather extremes. This well-written and well-researched book brings it all together.

An interesting aspect of this book is the accurate treatment the authors give to how oral traditions handed down by native peoples have kept the catastrophes alive. Such topics as the extinction of dinosaurs, the vanishing of ancient Indian tribes, the mysterious Carolina Bays, abrupt disappearance of the mammoths, the quick ending of the last Ice Age, and effects of underwater landslides causing tsunamis are discussed.

Folklore and legend have provided important keys to uncovering the past. The authors suggest that a situation may now be developing which could well pave the way for another catastrophe with greater consequences given the size of today's human population.

The illustrations, both black & white and in color, add to the stark reality of what once happened on Earth to civilizations, and what may come again more quickly than can be imagined! The illustrations are small, concise, and accompany the text in a nice format. Written by scientists, this book reads like a tight, exciting mystery novel. This is scary stuff.

A fine discussion of the "black mat" is examined, which explains the mysterious layer of black sediment found spanning the North American area resting directly over the bones of the last known mammoths to walk the Earth. A look at the Carolina Bays examines the thousands of miles-long depressions on the Atlantic coast that look much like Martian impact craters.

This book will have a wide appeal. The information touches upon the very fiber and core of our world civilization. What happens when the catastrophe comes again, what warfare by the survivors for the surviving scarce resources... all this and more is found and explained in this book. This is a memorable reading experience with much information to consider. This book is a page turner.

Search the history of over 431 billion web pages on the Internet. search Search the Wayback Machine. The authors claim to provide newly discovered scientific proof validating the legends and myths of ancient floods, fires, and weather extremes. Specifically, they claim to present new scientific evidence revealing the cause of the extinction of the dinosaurs, the vanishing of ancient Indian tribes, the formation of the mysterious Carolina Bays, the disappearance of the mammoths, the sudden ending of the last Ice Age, and the cause of huge underwater landslides that sent massive tsunamis racing across the oceans millennia ago. In prehistoric times, our ancestors learned about fire and used fire for their basic needs. The same fire caused destruction whenever misused or ill-handled. This is what we know now as the balance of nature, when you try to control nature itself will retaliate and will show her superiority over us. Floods are surely one of the most brutal ways of nature to avenge humankind and other living forms on the earth. It is inevitable; no human can stop it from happening. Perhaps the deadliest flood ever in the history of humankind took place in 1930, a severe drought afflicted almost the entire China. Due to isolated weather conditions over the central region, which began in the winter of late 1930, heavy snowstorms in the winter followed by heavy rains raised river levels significantly. Geomorphic, stratigraphic and fire records show no evidence of any sort of catastrophic changes in the environment at or immediately following the YDB. Late Pleistocene extinctions varied in time and across space. Archeological data provide no indication of population decline, demographic collapse or major adaptive shifts at or just after ≈ 12.9 ka. The data and the hypotheses generated by YDIH proponents are contradictory, inconsistent and incoherent.
